HVO Volunteer Provides Service Through Education

HVO has many short-term volunteer opportunities available including projects in Bhutan, Bolivia, China, Costa Rica, Ghana, Malawi, Myanmar, Nicaragua, the Philippines, St. Lucia, Tanzania, and Uganda. Assignments generally last two to four weeks and volunteers are placed throughout the year. Senior orthopaedic residents interested in volunteering at project sites may apply for the Orthopaedics Traveling Fellowship. For more information, visit www.hvousa.org.

In February 2018, Germaine Fritz, DO, traveled to Makerere University’s Mulago Hospital in Kampala, Uganda, to educate and train residents and staff of the hospital’s orthopaedics department.

It was the ninth country that Dr. Fritz, a hand surgeon, has visited during the 2016 AAOS Annual Meeting, he wrote, “Working with HVO will assist the staff and my institutions in a number of ways: impart knowledge and skills to staff, improve collaborative research between my university and international partner universities, and [further] development of orthopaedic subspecialties at Makerer teaching hospital in Mulago.”

Dr. Fritz found that her assignment in Uganda enabled her to do all that and more.

“There were lots of opportunities to teach. The residents were very interested, very motivated,” she said. “Another thing that impressed me was that the orthopaedic attending physicians were also very interested in learning. It wasn’t just the residents.”

Lectures, labs, and more

Dr. Fritz traveled to Uganda with two senior residents—Ryan Nielsen, DO, and Andrew Smith, DO. On the first day of their assignment, the team met with Dr. Kajja to develop an education plan for their two-week stay.

“Between the three of us, we provided two hours of lecture every morning. Residents came in every morning between 7 and 7:30 a.m. They normally don’t start their day until 9 a.m. or later,” noted Dr. Fritz. “They came because we were there.”

As one of the first hand surgery experts to volunteer at Mulago Hospital, Dr. Fritz had ample information to share with residents and staff. But she and her team didn’t just talk for two hours every morning—they offered plenty of opportunities for hands-on learning.

“I have a kind of lab where I staple some material that simulates flexor and extensor tendons and little nerve branches on cardboard,” said Dr. Fritz. “I help the residents learn how to sew smaller structures, and there are certain tendon-repair techniques that show them. I would draw it out on some cardboard. They took pictures of the cardboard; they were into it.”

Dr. Fritz always strives to make her lessons effective and fun.

“I try to make the education a little different, so it’s not just a lecture, and I don’t just read them slides,” Dr. Fritz said. “I gave the knife to a local resident and walked them through the procedure; the resident performed the procedure on the left leg and knew exactly what to do. It was a great learning experience.”

Dr. Fritz noted that the experience also had a positive impact on Drs. Nielsen and Smith.

“Both physicians increased their awareness of orthopaedics in a different way,” she said. “Their surgical skills and their teaching skills blossomed because they were able to show Ugandan residents things that they knew. The best way to learn is to teach somebody. They did a great job.”

Dr. Fritz plans to return to Mulago Hospital in 2019 to build on the training that her team undertook earlier this year, and she encourages others to consider their own volunteer assignments.

“My volunteer experience has been a wonderful part of my practice life. It’s everything I like about orthopaedics and nothing that I don’t, she said.
